

Installation Instructions

Please read all directions before carrying and Installation

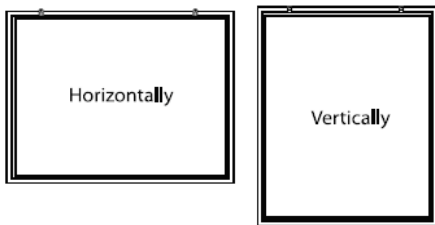

Proper Carrying (large and medium sizes)

Light panel must be held vertically when carried. Frame and LED strip will bow if carried flat and could result in breakage of internal parts (LED strips)

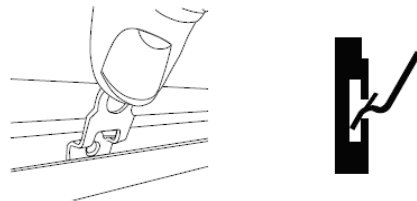

Step 1. Determine mounting direction

Determine if you are hanging LED light panel vertically or horizontally. The illustration below shows the approximate locations for installing your mounting clips.

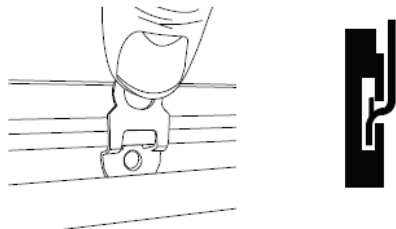

Step 2. Insert mounting clip (1)

Insert the supplied mounting clips into the groove on the top rear of the frame at approximately 45° angle.

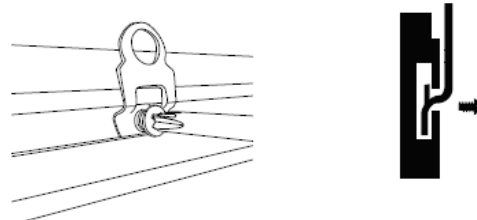

Step 3. Insert mounting clip (2)

Using your thumb apply pressure to the upper portion of the clip snapping it into the channel.

Step 4. Positioning mounting clip

Slide mounting clip to the desired location (See step. 1) then insert and tighten locking screw. Repeat step 2 through 4 for second clip.

Step 5. Mark and drill mounting holes

Hold frame in position on wall and check to make sure the frame is level. Drill a 1/4" hole at location of each clip in the desired mounting wall. Insert the wall anchors into the holes then using a screwdriver, insert the screws leaving approximately 1/4" exposed. IMPORTANT: Make sure the wall anchor is rated to hold the weight of the LED Slim Light box

Step 6. Mount light panel on wall

Mount frame by simply placing the mounting clip on the screw heads. Mounting clip position can be adjusted by loosening locking screw (See step 4).
